MEMORANDUM

To:	Chris Peregrin, California Department of Parks and Recreation
From:	Adam Poll, Dudek
Subject:	Air Quality and Greenhouse Gas Emissions Analysis for the Nelson Sloan Quarry Restoration Project – Scenario Evaluation
Date:	August 25, 2022
cc:	Josh Saunders, Dudek
Attachments:	A – Emissions Calculations B – Health Risk Assessment Output files C – City of San Diego Climate Action Plan Consistency Checklist

The purpose of this report is to evaluate potential air quality and greenhouse gas (GHG) impacts associated with construction and operation of the proposed Nelson Sloan Quarry Restoration and Beneficial Reuse of Sediment Project (Project) located within San Diego County, California. Potential air quality impacts are evaluated for their significance based on the criteria provided in the County of San Diego's Guidelines for Determining Significance and Report Format and Content Requirements – Air Quality (County of San Diego 2007) and the City of San Diego's Significance Determination Thresholds (City of San Diego 2016). The City's Climate Action Plan (CAP) Consistency Checklist is utilized to determine the Project's significance for GHG emissions. This assessment evaluates the air quality and GHG impacts associated with four Project scenarios as discussed further below.

Section 1 provides a description of the Project scenarios. Section 2, General Analysis and Methodology, outlines the methodology and assumptions used in the construction emissions analysis. Section 3, Air Quality Assessment, presents the thresholds of significance and impact discussion with respect to air quality. Section 4, Greenhouse Gas Emissions Assessment, presents the thresholds of significance and impact discussion with respect to GHG emissions. A summary of the assessment is presented in Section 5. Section 6, References, provides a list of the references cited.

1 Project Description

The Project would consist of the beneficial reuse of excess sediment deposited in flood control facilities and natural habitats in the Tijuana River Valley for the restoration of the previous Nelson Sloan Quarry site. More specifically, excess sediment extracted from flood control facilities maintained by the California Department of Parks and Recreation, City of San Diego (City), County of San Diego (County), and United States International Water and Boundary Commission that are currently hauled off site to area landfills or construction projects would instead be hauled to the Project site for processing and placement to reclaim the quarry to natural landform and habitat. In addition, the Project entails landform and habitat creation through sediment placement and compaction and revegetation efforts.

The approximately 40-acre Project site is in the southwestern portion of the County on lands owned by the County's Department of Parks and Recreation but within the City's land use jurisdiction. The project site is within the City's Tijuana River Valley Community Plan area. Restoration activities would occur within a 20-acre area encompassing Assessor's Parcel Number([APN) 664-011-05-00 and APN 664-011-04-00. The Project site is located within the southeastern corner of Tijuana River Valley Regional Park and abuts Monument Road and the City's South Bay Water Reclamation Plant immediately on the east. The International Water and Boundary Commission's South Bay International Wastewater Treatment Plant is located to the immediate east of the city water reclamation plant, approximately 0.35 miles east of the Project site. A new U.S. Customs and Border Protection station is currently being constructed between the two water treatment facilities on an approximately 30-acre site. A portion of the station site (APN 665-010-41-00) located north of Monument Road is currently being used for construction parking and staging for the international border fence replacement project. The Project site is bordered by federal lands managed by the U.S. Customs and Border Protection to the south and by County lands to the west and north.

The Project site is vacant and is crossed by several dirt roads and paths. An aboveground water line and disturbance associated with previous staging and soil/sediment stockpile areas is visible in the eastern portion of the site. The site terrain consists of coastal highlands up to 425 feet in elevation, with finger canyons on APN 664-011-04-00 extending north to the Tijuana River Valley. The elevated vantage point provided by the mesa on APN 664-011-04-00 is occasionally used by USCBP for visual surveillance of the border fence and surrounding area to the east. With the exception of descending slopes in the western portion, APN 664-011-05-00 is relatively flat and features a gradual slope. With the exception of overhead lights installed by USCBP atop the mesa on APN 664-011-04-00, there are no structures located on site.

The four Project scenarios evaluated herein are as follows:

- Scenario 1A: TETRP II with Screening at Nelson Sloan Site
  - Operations occur 6 months per year (applicable to 2-year timeframe of TETRP and remaining Nelson Sloan Project timeline)
  - During 2-year duration of TETRP II, Nelson Sloan would accept 200,000 cubic yards (CY) of sediment per year
  - Once TETRP is complete, Nelson Sloan operations would continue at 6 months per year frequency until site/Project goal of 1 million CY of sediment (assumes annual available CY of sediment is 75,000 CY
  - Total Project duration = 10 years
- Scenario 1B: TETRP II with Screening at Nelson Sloan Site
  - Operations occur 12 months per year (applicable to 2-year timeframe of TETRP and remaining Nelson Sloan Project timeline)
  - During two-year duration of TETRP II, Nelson Sloan would accept 325,000 CY of sediment per year
  - Once TETRP is complete, Nelson Sloan operations would continue at 12 months per year frequency until site/Project goal of 1 M CY of sediment (assumes annual available CY of sediment is 75,000 CY
  - Total Project duration = approximately 7 years
- Scenario 2A: TETRP II with NO Screening at Nelson Sloan Site
  - Operations occur 6 months per year (applicable to 2-year timeframe of TETRP and remaining Nelson Sloan Project timeline)

- During 2-year duration of TETRP II, Nelson Sloan would accept 200,000 CY of sediment per year
- Once TETRP is complete, Nelson Sloan operations would continue at 6 months per year frequency until site/Project goal of 1 M CY of sediment (assumes annual available CY of sediment is 75,000 CY
- Total Project duration = 10 years

- Scenario 2B: TETRP II with NO Screening at Nelson Sloan Site
  - Operations occur 12 months per year (applicable to 2-year timeframe of TETRP and remaining Nelson Sloan Project timeline)
  - During 2-year duration of TETRP II, Nelson Sloan would accept 400,000 CY of sediment per year
  - Once TETRP is complete, Nelson Sloan operations would continue at 6 months per year frequency until site/Project goal of 1 M CY of sediment (assumes annual available CY of sediment is 75,000 CY
  - Total Project duration = 5 years

2 General Analysis and Methodology

2.1 Scenario 1A

The Project would involve relocation of approximately 1 million cubic yards of sediment. The sediment would be excavated from and hauled from sediment basins within the Tijuana River Valley and transported to the Project site. The sediment would be screened and processed at the Project site and then placed and compacted on the Project site.

For purposes of estimating Project emissions, and based on information provided by the California Department of Parks and Recreation, it is assumed that the reclamation phases of the Project would commence in January 2023[1] and would last approximately 10 years. The Project would only operate September 15 through March 15 within this time period. The analysis contained herein is based on the following subset area schedule assumptions (duration of phases is approximate). Detailed construction equipment modeling assumptions are provided in Appendix A. Table 1 shows the estimated sediment volume and duration per phase.

Table 1. Estimated Reclamation and Grading Activity – Scenario 1A

Year	Sediment Volume Required (cubic yards)	Total Haul Truck Trips (one-way)	Daily Vendor Truck Trips (one-way)	Daily Worker Trips (one-way)
1	200,000	0	6	22
2	200,000	0	6	22
3	75,000	9,375	6	22
4	75,000	9,375	6	22
5	75,000	9,375	6	22
6	75,000	9,375	6	22

[1] The analysis assumes a construction start date of January 2023, which represents the earliest date construction would initiate. Assuming the earliest start date for construction represents the worst-case scenario for criteria air pollutant emissions because equipment and vehicle emission factors for later years would be slightly less due to more stringent standards for in-use off-road equipment and heavy-duty trucks, as well as fleet turnover replacing older equipment and vehicles in later years.

Table 1. Estimated Reclamation and Grading Activity – Scenario 1A

Year	Sediment Volume Required (cubic yards)	Total Haul Truck Trips (one-way)	Daily Vendor Truck Trips (one-way)	Daily Worker Trips (one-way)
7	75,000	9,375	6	22
8	75,000	9,375	6	22
9	75,000	9,375	6	22
10	75,000	9,375	6	22
Total	1,000,000	75,000	N/A	N/A

Notes: N/A = not applicable.
Haul trips during years 1 and 2 are from TETRP and assumed to be evaluated in a separate environmental analysis.

Revegetation of disturbed areas of the site would be completed in phases and occur after final graded surfaces are achieved. Maintenance activities would be conducted concurrent with the installation of container plants and seeding, would continue throughout the initial 120-day establishment period, through the interim maintenance and monitoring period, and conclude at the end of the 5-year period for each mitigation phase. It is estimated that one biologist and vendor planter truck would travel to the site monthly. No equipment would be required during the monitoring phases.

Emissions from the Project were estimated using the California Emissions Estimator Model (CalEEMod) (CAPCOA 2021). Assumptions, including phasing, equipment mix, and vehicle trips, were based on information provided by the California Department of Parks and Recreation, CalEEMod defaults, and best engineering judgement. Fugitive dust emissions from screening and handling the soil were estimated using a spreadsheet model and emission factors from the US EPA AP-42 Section 11.19.1, Emission Factors for Crushed Stone Processing Operations (EPA 2004), and Section 13.2.4, Aggregate Handling and Storage Piles (EPA 2006). Detailed offroad equipment per phase is provided in Appendix A.

Default values for equipment horsepower and load factor provided in CalEEMod were used for all off-road equipment. For the analysis, it was generally assumed that heavy-duty off-road equipment would be operating at the site 5 days per week. The CalEEMod default assumptions were used for worker and vendor trip distances. For the haul trucks, the farthest sediment basin from the Project site was assumed for all haul trips (3.2 miles). This is conservative because the other two sediment basins are closer to the Project site. It was assumed that 15% of the sediment processed at the Project site would need to be disposed of off-site. Miramar landfill was assumed to be the disposal site, which is 26 miles from the Project site. It was assumed that 0.5 miles of unpaved road travel would occur per worker, vendor, and haul truck trip.

2.2 Scenario 1B

The Project would involve relocation of approximately 1 million cubic yards of sediment. The sediment would be excavated from and hauled from sediment basins within the Tijuana River Valley and transported to the Project site. The sediment would be screened and processed at the Project site and then placed and compacted on the Project site.

For purposes of estimating Project emissions, and based on information provided by the California Department of Parks and Recreation, it is assumed that the reclamation phases of the Project would commence in January 2023[2] and would last approximately 7 years. The Project would operate year-round within this time period. The analysis contained herein is based on the following subset area schedule assumptions (duration of phases is approximate). Detailed construction equipment modeling assumptions are provided in Appendix A. Table 2 shows the estimated sediment volume and duration per phase.

Table 2. Estimated Reclamation and Grading Activity – Scenario 1B

Year	Sediment Volume Required (cubic yards)	Total Haul Truck Trips (one-way)	Daily Vendor Truck Trips (one-way)	Daily Worker Trips (one-way)
1	325,000	0	6	22
2	325,000	0	6	22
3	75,000	9,375	6	22
4	75,000	9,375	6	22
5	75,000	9,375	6	22
6	75,000	9,375	6	22
7	50,000	6,250	6	22
Total	1,000,000	43,750	N/A	N/A

Notes: N/A = not applicable.
Haul trips during years 1 and 2 are from TETRP and assumed to be evaluated in a separate environmental analysis.

Revegetation of disturbed areas of the site would be completed in phases and occur after final graded surfaces are achieved. Maintenance activities would be conducted concurrent with the installation of container plants and seeding, would continue throughout the initial 120-day establishment period, through the interim maintenance and monitoring period, and conclude at the end of the 5-year period for each mitigation phase. It is estimated that one biologist and vendor planter truck would travel to the site monthly. No equipment would be required during the monitoring phases.

Emissions from the Project were estimated using the California Emissions Estimator Model (CalEEMod) (CAPCOA 2021). Assumptions, including phasing, equipment mix, and vehicle trips, were based on information provided by the California Department of Parks and Recreation, CalEEMod defaults, and best engineering judgement. 10	75,000	9,375	6	22
Total	**1,000,000**	**75,000**	**N/A**	**N/A**

Notes: N/A = not applicable.
Haul trips during years 1 and 2 are from TETRP and assumed to be evaluated in a separate environmental analysis.

[3] The analysis assumes a construction start date of January 2023, which represents the earliest date construction would initiate. Assuming the earliest start date for construction represents the worst-case scenario for criteria air pollutant emissions because equipment and vehicle emission factors for later years would be slightly less due to more stringent standards for in-use off-road equipment and heavy-duty trucks, as well as fleet turnover replacing older equipment and vehicles in later years.

Revegetation of disturbed areas of the site would be completed in phases and occur after final graded surfaces are achieved. Maintenance activities would be conducted concurrent with the installation of container plants and seeding, would continue throughout the initial 120-day establishment period, through the interim maintenance and monitoring period, and conclude at the end of the 5-year period for each mitigation phase. It is estimated that one biologist and vendor planter truck would travel to the site monthly. No equipment would be required during the monitoring phases.

Emissions from the Project were estimated using the California Emissions Estimator Model (CalEEMod) (CAPCOA 2021). Assumptions, including phasing, equipment mix, and vehicle trips, were based on information provided by the California Department of Parks and Recreation, CalEEMod defaults, and best engineering judgement. Fugitive dust emissions from screening and handling the soil were estimated using a spreadsheet model and emission factors from the US EPA AP-42 Section 11.19.1, Emission Factors for Crushed Stone Processing Operations (EPA 2004), and Section 13.2.4, Aggregate Handling and Storage Piles (EPA 2006). Detailed offroad equipment per phase is provided in Appendix A.

Default values for equipment horsepower and load factor provided in CalEEMod were used for all off-road equipment. For the analysis, it was generally assumed that heavy-duty off-road equipment would be operating at the site 5 days per week. The CalEEMod default assumptions were used for worker and vendor trip distances. For the haul trucks, the farthest sediment basin from the Project site was assumed for all haul trips (3.2 miles). This is conservative because the other two sediment basins are closer to the Project site. It was assumed that 15% of the sediment processed at the Project site would need to be disposed of off-site. Miramar landfill was assumed to be the disposal site, which is 26 miles from the Project site. It was assumed that 0.5 miles of unpaved road travel would occur per worker, vendor, and haul truck trip.

2.4 Scenario 2B

The Project would involve relocation of approximately 1 million cubic yards of sediment. The sediment would be excavated from and hauled from sediment basins within the Tijuana River Valley and transported to the Project site. The sediment would be screened and processed at the Project site and then placed and compacted on the Project site.

For purposes of estimating Project emissions, and based on information provided by the California Department of Parks and Recreation, it is assumed that the reclamation phases of the Project would commence in January 2023[4] and would last approximately 5 years. The Project would operate year-round within this time period. The analysis contained herein is based on the following subset area schedule assumptions (duration of phases is approximate). Detailed construction equipment modeling assumptions are provided in Appendix A. Table 4 shows the estimated sediment volume and duration per phase.

[4] The analysis assumes a construction start date of January 2023, which represents the earliest date construction would initiate. Assuming the earliest start date for construction represents the worst-case scenario for criteria air pollutant emissions because equipment and vehicle emission factors for later years would be slightly less due to more stringent standards for in-use off-road equipment and heavy-duty trucks, as well as fleet turnover replacing older equipment and vehicles in later years.

Table 4. Estimated Reclamation and Grading Activity – Scenario 2B

Year	Sediment Volume Required (cubic yards)	Total Haul Truck Trips (one-way)	Daily Vendor Truck Trips (one-way)	Daily Worker Trips (one-way)
1	400,000	0	6	22
2	400,000	0	6	22
3	75,000	9,375	6	22
4	75,000	9,375	6	22
5	50,000	6,250	6	22
Total	1,000,000	25,000	N/A	N/A

Notes: N/A = not applicable.
Haul trips during years 1 and 2 are from TETRP and assumed to be evaluated in a separate environmental analysis.

Revegetation of disturbed areas of the site would be completed in phases and occur after final graded surfaces are achieved. Maintenance activities would be conducted concurrent with the installation of container plants and seeding, would continue throughout the initial 120-day establishment period, through the interim maintenance and monitoring period, and conclude at the end of the 5-year period for each mitigation phase. It is estimated that one biologist and vendor planter truck would travel to the site monthly. No equipment would be required during the monitoring phases.

Emissions from the Project were estimated using the California Emissions Estimator Model (CalEEMod) (CAPCOA 2021). Assumptions, including phasing, equipment mix, and vehicle trips, were based on information provided by the California Department of Parks and Recreation, CalEEMod defaults, and best engineering judgement. Fugitive dust emissions from screening and handling the soil were estimated using a spreadsheet model and emission factors from the US EPA AP-42 Section 11.19.1, Emission Factors for Crushed Stone Processing Operations (EPA 2004), and Section 13.2.4, Aggregate Handling and Storage Piles (EPA 2006). Detailed offroad equipment per phase is provided in Appendix A.

Default values for equipment horsepower and load factor provided in CalEEMod were used for all off-road equipment. For the analysis, it was generally assumed that heavy-duty off-road equipment would be operating at the site 5 days per week. The CalEEMod default assumptions were used for worker and vendor trip distances. For the haul trucks, the farthest sediment basin from the Project site was assumed for all haul trips (3.2 miles). This is conservative because the other two sediment basins are closer to the Project site. It was assumed that 15% of the sediment processed at the Project site would need to be disposed of off-site. Miramar landfill was assumed to be the disposal site, which is 26 miles from the Project site. It was assumed that 0.5 miles of unpaved road travel would occur per worker, vendor, and haul truck trip.

2.5 Health Risk Assessment

A health risk assessment (HRA) was performed to assess the impact of the Project on sensitive receptors proximate to the Project site. This report includes an HRA associated with emissions from the Project based on the methodologies prescribed in OEHHA's Air Toxics Hot Spots Program Risk Assessment Guidelines— Guidance Manual for Preparation of Health Risk Assessments (OEHHA 2015). To implement the OEHHA guidelines based on Project information, the SDAPCD developed a three-tiered approach where each successive tier is progressively more

refined, with fewer conservative assumptions. The SDAPCD Supplemental Guidelines for Submission of Air Toxics "Hot Spots" Program Health Risk Assessments provides guidance with which to perform HRAs within the SDAB (SDAPCD 2022).

Health effects from carcinogenic air toxics are usually described in terms of cancer risk. The SDAPCD recommends a carcinogenic (cancer) risk threshold of 10 in 1 million. However, the County implements a threshold of 1 in 1 million without the use of T-BACT and 10 in 1 million with the use of T-BACT. Additionally, some TACs increase non-cancer health risk due to long-term (chronic) exposures. The Chronic and Acute Hazard Index is the sum of the individual substance chronic hazard indices for all TACs affecting the same target organ system. The SDAPCD and County recommend a Chronic Hazard Index significance threshold of 1.0 (project increment). The exhaust from diesel engines (DPM) is a complex mixture of gases, vapors, and particles, many of which are known human carcinogens. DPM has established cancer risk factors and relative exposure values for long-term chronic health hazard impacts. In addition to TAC emissions from exhaust, there are TACs found within fugitive dust emissions (off-road equipment movement, processing plant, and on-site vehicle traffic). Emissions from fugitive dust TAC emissions include crystalline silica, aluminum, arsenic, barium, beryllium, chromium nonhexavalent, copper, manganese, lead, zinc, and other TAC emissions reported in the 2014 Goat Canyon Sediment Analysis (Ecology and Environment, Inc. 2014). Fugitive dust emissions are generated from soil disturbance, and the TAC emissions from soil constituents, when inhaled, can get trapped in the lungs' alveoli and penetrate into the circulatory system, causing deleterious impacts on public health. The HRA evaluated the risk to existing residents from diesel emissions from exhaust from off-road equipment and diesel haul and vendor trucks, as well as fugitive dust TAC emissions (see Appendix B).

The dispersion modeling of DPM and fugitive dust TAC emissions was performed using the American Meteorological Society/EPA Regulatory Model (AERMOD), which is the model SDAPCD requires for atmospheric dispersion of emissions. AERMOD is a steady-state Gaussian plume model that incorporates air dispersion based on planetary boundary layer turbulence structure and scaling concepts, including treatment of surface and elevated sources, building downwash, and simple and complex terrain (EPA 2022). For the Project, AERMOD was run with all sources emitting unit emissions (1 gram per second) to obtain the "X/Q" values. X/Q is a dispersion factor that is the average effluent concentration normalized by source strength and is used as a way to simplify the representation of emissions from many sources. The X/Q values of ground-level concentrations were determined for construction emissions using AERMOD and the maximum concentrations determined for the 1-hour and period-averaging times. Principal parameters of this modeling are presented in Table 5.

Table 5. AERMOD Principal Parameters

Parameter	Details
Meteorological Data	The latest 3-year meteorological data (2010–2012) for the Chula Vista Station provided by the San Diego Air Pollution Control District (SDAPCD) were downloaded and then input to AERMOD. For cancer or chronic noncancer risk assessments, the average cancer risk of all years modeled was used.
Urban versus Rural Option	Urban areas typically have more surface roughness, as well as structures and low-albedo surfaces that absorb more sunlight—and thus more heat—relative to rural areas. However, based on the SDAPCD guidelines and the Project location, the rural dispersion option was selected (SDAPCD 2022).
Terrain Characteristics	Terrain in the vicinity of the modeled Project site is generally hilly. The elevation of the modeled site is between 92 and 160 feet above sea level. Digital elevation model files

Table 5. AERMOD Principal Parameters

Parameter	Details
	were imported into AERMOD so that complex terrain features were evaluated as appropriate.
Elevation Data	Digital elevation data were imported into AERMOD, and elevations were assigned to the emissions sources and receptors. Digital elevation data were obtained through AERMOD View in the U.S. Geological Survey's National Elevation Dataset format with a 30-meter resolution.
Emission Sources and Release Parameters	Air dispersion modeling of diesel particulate matter and fugitive dust toxic air contaminants from off-road equipment and diesel vehicles was conducted using emissions estimated using CalEEMod, assuming emissions would occur up to 8 hours per day, 5 days per week.
Source Release Characterizations	Off-road equipment at the Project site were modeled as a series of line volume sources with a source release height of 5 meters and a length of 25 meters on each side. The on-site vendor truck and off-site diesel exhaust from vendor and haul truck traffic were modeled as lines of adjacent volume sources. Based on U.S. Environmental Protection Agency methodology, the modeled sources would result in a release height of 3.4 meters, a plume height of 3.16 meters, and a plume width of 3.12 meters (EPA 2015). Truck idling emissions were modeled as point sources with a 4-meter exhaust height and 0.1 meters exhaust diameter (EPA 2015; SCAQMD 2003; SJVAPCD 2006). The modeling parameters for the screening plant were based on the National Stone, Sand, and Gravel Association's Modeling Fugitive Dust Sources (NSSGA 2004). The screens were modeled as volume sources, with a source release height assumed to be 4.6 meters, and the lengths of the volume sources were assumed to be 3 meters on each side.
Discrete Receptors	The receptors in proximity to the site are sporadic. Discrete receptors were placed at identified existing residential structures. Cartesian grids were placed in residential neighborhoods located across the U.S./Mexico border.

Note: See Appendix B.

Dispersion model plotfiles from AERMOD were then imported into CARB's Hotspots Analysis and Reporting Program Version 2 to determine health risk, which requires peak 1-hour emission rates and annual-averaged emission rates for all pollutants for each modeling source. For the residential health risk, the HRA assumed exposure would start in the third trimester of pregnancy and last the duration of the Project for each scenario. Based on the HRA provided in Appendix B, the maximally exposed individual resident would be located west of the Project site. The results of the HRA are provided in Section 3.2.3, Impacts to Sensitive Receptors, herein, and detailed results and methodology are provided in Appendix B.

In addition to the cancer and non-cancer HRA prepared for the Project, a lead exposure screening assessment was performed in accordance with CARB's Risk Management Guidelines for Lead (CARB 2001). This screening used the same AERMOD setup as described above for the HRA, but used lead as the pollutant and modeled the actual emissions of lead for the Project, as opposed to the unit emissions rate of 1 gram per second.

3 Air Quality Assessment

3.1 Thresholds of Significance

California has developed guidelines to address the significance of air quality impacts that are contained in Appendix G of the California Environmental Quality Act (CEQA) Guidelines. Based on those guidelines, a Project would have a significant environmental impact if it would:

1. Conflict with or obstruct the implementation of the applicable air quality plan
2. Result in a cumulatively considerable net increase of any criteria pollutant for which the Project region is in nonattainment under an applicable federal or state ambient air quality standard
3. Expose sensitive receptors to substantial pollutant concentrations
4. Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people.

Project Thresholds

Because the California Department of Parks and Recreation does not have established significance thresholds, and because the Project site is within both the City and County of San Diego, this analysis compared the thresholds of both the City and County and selected the most stringent to be applied. The thresholds applied to the Project are shown below and indicated by whether they are based on the City's or County's guidelines.

- The Project would conflict with or obstruct the implementation of the SDAPCD's RAQS and/or applicable portions of the SIP (County of San Diego 2007).
- The Project would result in a cumulatively considerable net increase of any criteria pollutant for which the SDAB is in nonattainment under an applicable federal or state Ambient Air Quality Standard (County of San Diego 2007).
    - The following guidelines for determining significance must be used for determining whether the net increase during the construction phase is cumulatively considerable:
        - A project that has a significant direct impact on air quality with regard to construction-related emissions of PM_{10}, $PM_{2.5}$, NO_x, and/or VOCs would also have a significant cumulatively considerable net increase (County of San Diego 2007).
        - In the event direct impacts from a proposed project are less than significant, a project may still have a cumulatively considerable impact on air quality if the construction-related emissions of concern from a proposed project, in combination with the emissions of concern from other proposed projects or reasonably foreseeable future projects within a proximity relevant to the pollutants of concern, are in excess of the guidelines, including the SDAPCD's screening-level thresholds (County of San Diego 2007).
    - The following guidelines for determining significance must be used for determining whether the net increase during the operational phase is cumulatively considerable:
        - A project that does not conform to the SDPACD's RAQS and/or has a significant direct impact on air quality with regard to operational-related emissions of PM_{10}, $PM_{2.5}$, NO_x, and/or VOCs would also have a significant cumulatively considerable net increase (County of San Diego 2007).

- If a proposed development causes a six-lane road to deteriorate to LOS E or worse, the resulting longer queuing at the traffic signals could cause a localized significant air quality impact (City of San Diego 2016). A site-specific CO hotspot analysis should be performed to determine if health standards are potentially violated and to identify any affected sensitive receptor. If a proposed development causes a six-lane road to drop to LOS F, the resultant extended wait at the signalized intersections could cause a significant air quality impact (City of San Diego 2016). A site-specific CO hotspot screening and/or analysis should be performed to determine if health standards are potentially violated and to identify any affected sensitive receptor (City of San Diego 2016). If a proposed development causes a four-lane road to drop to LOS E or worse, the extended wait at the signalized intersection could cause a significant air quality impact. A site-specific CO hotspot screening and/or analysis should be performed to determine if health standards are potentially violated and to identify any affected sensitive receptor (City of San Diego 2016). If a proposed development is within 400 feet of a sensitive receptor and the LOS is worse than D, a site-specific CO hotspot analysis should be performed to determine if health standards are potentially exceeded and to determine the level of adverse effect on the receptors (City of San Diego 2016).
- In the event direct impacts from a proposed project are less than significant, a project may still have a cumulatively considerable impact on air quality if the operational-related emissions of concern from a proposed project, in combination with the emissions of concern from other proposed projects or reasonably foreseeable future projects within a proximity relevant to the pollutants of concern, are in excess of the guidelines, including the SDAPCD's screening-level thresholds (County of San Diego 2007).

- The project would expose sensitive receptors to substantial pollutant concentrations (County of San Diego 2007).
- The project places sensitive receptors near CO hotspots or creates CO hotspots near sensitive receptors (County of San Diego 2007).
- Project implementation would result in exposure to TACs resulting in a (County of San Diego 2007):
  - Maximum incremental cancer risk equal to or greater than 1 in one million without application of Toxics-Best Available Control Technology (T-BACT), or
  - Maximum incremental cancer risk equal to or greater than 10 in one million with application of T-BACT, or
  - Cancer burden equal to or greater than 1.0, or
  - Total acute non-cancer health hazard index equal to or greater than 1.0, or
  - Total chronic non-cancer health hazard index equal to or greater than 1.0.
  - The project, which is not an agricultural, commercial, or an industrial activity subject to SDAPCD standards, as a result of implementation, would either generate objectionable odors or place sensitive receptors next to existing objectionable odors, which would affect a considerable number of persons or the public (County of San Diego 2007).

As part of its air quality permitting process, the SDAPCD has established thresholds in Rule 20.2 requiring the preparation of an Air Quality Impact Assessment for permitted stationary sources. The SDAPCD sets forth quantitative emissions thresholds below which a stationary source would not have a significant impact on ambient air quality. Project air quality impacts estimated in this environmental analysis would be significant if any of the applicable significance thresholds presented in Table 6, SDAPCD Air Quality Significance Thresholds, are exceeded.

Table 6. SDAPCD Air Quality Significance Thresholds

Construction Emissions			
Pollutant	**Total Emissions (Pounds per Day)**		
Respirable Particulate Matter (PM_{10})	100		
Fine Particulate Matter ($PM_{2.5}$)	55		
Oxides of Nitrogen (NO_x)	250		
Sulfur Oxides (SO_x)	250		
Carbon Monoxide (CO)	550		
Volatile Organic Compounds (VOC)	75[a]		
Operational Emissions			
	Total Emissions		
Pollutant	**Pounds per Hour**	**Pounds per Day**	**Tons per Year**
Respirable Particulate Matter (PM_{10})	N/A	100	15
Fine Particulate Matter ($PM_{2.5}$)	N/A	55	10
Oxides of Nitrogen (NO_x)	25	250	40
Sulfur Oxides (SO_x)	25	250	40
Carbon Monoxide (CO)	100	550	100
Lead and Lead Compounds	N/A	3.2	0.6
Volatile Organic Compounds (VOCs)	N/A	75[a]	13.7

Sources: SDAPCD Rule 1501 (SDAPCD 1995) and Rule 20.2(d)(2) (SDAPCD 2016b).

[a] VOC threshold based on the threshold of significance for VOC from the South Coast Air Quality Management District for the Coachella Valley as stated in the San Diego County Guidelines for Determining Significance (County of San Diego 2007).

The thresholds listed in Table 6 represent screening-level thresholds that can be used to evaluate whether project emissions could cause a significant impact on air quality. Emissions below the screening-level thresholds would not cause a significant impact. The emissions-based thresholds for O_3 precursors are intended to serve as a surrogate for an "O_3 significance threshold" (i.e., the potential for adverse O_3 impacts to occur). This approach is used because O_3 is not emitted directly, and the effects of an individual project's emissions of O_3 precursors (VOC and NO_x) on O_3 levels in ambient air cannot be determined through air quality models or other quantitative methods. For nonattainment pollutants, if emissions exceed the thresholds shown in Table 6, the project could have the potential to result in a cumulatively considerable net increase in these pollutants, and, thus, could have a significant impact on ambient air quality.

With respect to odors, SDAPCD Rule 51 (Public Nuisance) prohibits emission of any material that causes nuisance to a considerable number of people or endangers the comfort, health, or safety of any person. A project that proposes a use that would produce objectionable odors would be deemed to have a significant odor impact if it would affect a considerable number of off-site receptors.

3.2 Impact Analysis

3.2.1 Conformance to the Regional Air Quality Strategy

3.2.1.1 Guideline for the Determination of Significance

Based on Appendix G of the CEQA Guidelines and the County's Guidelines for Determining Significance and Report Format and Content Requirements – Air Quality (County of San Diego 2007), the project would have a significant impact if it would:

- Conflict with or obstruct the implementation of the RAQS and/or applicable portions of the SIP.

3.2.1.2 Significance of Impacts Prior to Mitigation

As previously discussed, the SDAPCD and SANDAG are responsible for developing and implementing the clean air plans for attainment and maintenance of the ambient air quality standards in the SDAB, specifically the SIP and RAQS.[5] The federal O_3 attainment plan, which is part of the SIP, was adopted in 2016. The SIP includes a demonstration that current strategies and tactics will maintain acceptable air quality in the SDAB based on the NAAQS. The RAQS was initially adopted in 1991 and is typically updated on a triennial basis (most recently in 2016). The RAQS outlines SDAPCD's plans and control measures designed to attain the state air quality standards for O_3. The SIP and RAQS rely on information from CARB and SANDAG, including mobile and area source emissions, as well as information regarding projected growth in the County and the cities in the County, to project future emissions and then determine from that the strategies necessary for the reduction of emissions through regulatory controls. CARB's mobile source emissions projections and SANDAG's growth projections are based on population, vehicle trends, and land use plans developed by the County and the cities in the County as part of development of their general plans.

As mentioned above, the SIP and RAQS rely on SANDAG growth projections based on population, vehicle trends, and land use plans developed by the cities and by the County as part of development of their general plans. As such, projects that involve development that is consistent with the growth anticipated by local plans would be consistent with the SIP and RAQS. However, if a project involves development that is greater than that anticipated in the local plan and/or SANDAG's growth projections, that project might be in conflict with the SIP and RAQS, and may contribute to a potentially significant cumulative impact on air quality.

The Project site is owned by the County of San Diego. The site's APNs are 664-011-50-00 and 664-011-04-00. Under the City of San Diego's General Plan, the Project site is designated as Open Space Parks and is listed as Proposition A land. Proposition A land is characterized as "very low-density, residential, open space, natural resource-based park, and agricultural uses" (County of San Diego 2011). Under the Tijuana River Valley Community Plan, the site is designated as Multiple Species Conservation Open Space, which prohibits any commercial recreation or urban residential land use designations. The Project site is zoned as AR-1-1, or Agricultural – Residential zones. Agricultural – Residential zones allow the development of single dwelling unit homes at a very

[5] For the purpose of this discussion, the relevant federal air quality plan is the Ozone Attainment Plan (SDAPCD 2016a). The RAQS is the applicable plan for purposes of state air quality planning. Both plans reflect growth projections in the SDAB.

low density (minimum 10-acre lots) (City of San Diego 2007). The Project site's land use designation and zoning are not expected to change.

The Project would be consistent with the underlying zoning for the site parcels, which means that the Project was currently included within the SIP and RAQS. Moreover, the Project does not propose residential, commercial, or growth-inducing development. Therefore, emissions from the Project would be considered consistent with what is already included within the RAQS and SIP.

Since the Project would not contribute to local population growth or substantial employment growth and the growth-related emissions, the proposed Project is considered accounted for in the SIP and RAQS, and the Project would not conflict with or obstruct implementation of local air quality plans. Impacts would be **less than significant**.

3.2.1.3 Mitigation

No mitigation is required.

3.2.1.4 Conclusion

Impacts would remain **less than significant** without mitigation.

3.2.2 Cumulatively Considerable Net Increase of Criteria Pollutants

In analyzing cumulative impacts from a project, the analysis must specifically evaluate a project's contribution to the cumulative increase in pollutants for which the SDAB is listed as nonattainment for the state and federal ambient air quality standards. The SDAB has been designated as a federal nonattainment area for O_3 and a state nonattainment area for O_3, PM_{10}, and $PM_{2.5}$. The nonattainment status is the result of cumulative emissions from all sources of these air pollutants and their precursors within the SDAB. The project would have a cumulatively considerable impact if emissions generated by the project would exceed thresholds for VOC or NO_x (O_3 precursors), PM_{10}, and/or $PM_{2.5}$. If the project does not exceed thresholds and is determined to have less-than-significant impacts, it may still have a cumulatively considerable impact on air quality if emissions from the project, in combination with emissions from other proposed or reasonably foreseeable future projects, are in excess of established thresholds. However, the project would have a cumulative impact only if the project's contribution accounts for a significant proportion of the cumulative total emissions.

Background ambient air quality, as measured at the monitoring stations maintained and operated by SDAPCD, is the concentration of pollutants from existing sources; therefore, past and present impacts are included in the background ambient air quality data.

Geographic Extent

The geographic extent for the analysis of cumulative impacts related to air quality is the south-central portion of the SDAB (San Diego County). Due to the nonattainment status of the SDAB, the primary air pollutants of concern are VOC and NO_x, which are O_3 precursors, and PM_{10} and $PM_{2.5}$. Because of the nature of O_3 as a regional air pollutant, emissions from the entire geographic area for this cumulative impact analysis would tend to be important. PM_{10}

and $PM_{2.5}$ impacts, on the other hand, tend to occur locally; thus, projects occurring in the same general area and in the same time period tend to create cumulative air quality impacts.

Existing Cumulative Conditions

Air quality management in the geographic area for the cumulative impact assessment is the responsibility of the SDAPCD. Existing levels of development in the county have led to the nonattainment status for O_3 with respect to the CAAQS and NAAQS, and for PM_{10} and $PM_{2.5}$ with respect to the CAAQS. The nonattainment status is based on ambient air quality monitoring generally conducted in the urban portions of the county. Due to its proximity to the Project site, similar geographic and climactic characteristics, and available measured ambient concentrations of pollutants, the Otay Mesa-Donavan facility monitoring station monitors O_3, NO_2, PM_{10}, and $PM_{2.5}$. The El Cajon-Floyd Smith Drive monitoring station monitors concentrations for CO and SO_2 pollutants, and is considered most representative of the Project site for those pollutants. The air quality plans prepared by the SDAPCD reflect future growth under local development plans, but they are intended to reduce emissions countywide to levels that would comply with the NAAQS and CAAQS through implementation of new regulations at the local, state, and federal levels.

The separate guidelines of significance discussed below were developed to respond to the following question from the CEQA Guidelines Appendix G:

- Would the Project result in a cumulatively considerable net increase of any criteria pollutant for which the SDAB is nonattainment under an applicable federal or state ambient air quality standard?

3.2.2.1 Guidelines for the Determination of Significance

Cumulatively considerable net increases during the construction phase would typically occur if two or more projects near each other are simultaneously under construction. The following guidelines for determining significance must be used for determining the cumulatively considerable net increases during the construction phase (County of San Diego 2007):

- A project that has a significant direct impact on air quality with regard to emissions of PM_{10}, $PM_{2.5}$, NO_x, and/or VOCs would also have a significant cumulatively considerable net increase.
- In the event direct impacts from a project are less than significant, a project may still have a cumulatively considerable impact on air quality if the emissions of concern from that project, in combination with the emissions of concern from other projects or reasonably foreseeable future projects within a proximity relevant to the pollutants of concern, are in excess of guidelines.
- A project that does not conform to the RAQS and/or has a significant direct impact on air quality with regard to operational emissions of PM_{10}, $PM_{2.5}$, NO_x, and/or VOCs would also have a significant cumulatively considerable net increase.
  - Projects that cause road intersections to operate at or below LOS E (analysis only required when the addition of peak-hour trips from a project and surrounding projects exceeds 2,000) and create a CO hotspot create a cumulatively considerable net increase of CO.

3.2.2.2 Significance of Impacts Prior to Mitigation

In analyzing cumulative impacts from the Project, the analysis must specifically evaluate a project's contribution to the cumulative increase in pollutants for which the SDAB is designated as nonattainment for the CAAQS and NAAQS. If the Project's emissions do not exceed thresholds and are determined to have less-than-significant project-specific impacts, the Project may still contribute to a significant cumulative impact on air quality if the emissions from the project, in combination with the emissions from other proposed or reasonably foreseeable future projects, are in excess of established thresholds.

The Project would result in the temporary addition of pollutants to the local airshed caused by on-site sources (e.g., off-road construction equipment, soil disturbance, and internal haul trucks) and off-site sources (e.g., vendor trucks and worker vehicle trips). Specifically, entrained dust results from the exposure of earth surfaces to wind from the direct disturbance and movement of soil, resulting in PM_{10} and $PM_{2.5}$ emissions. Internal combustion engines used by off-road equipment, internal haul trucks, vendor trucks (i.e., delivery trucks), and worker vehicles would result in emissions of VOCs, NO_x, CO, PM_{10}, and $PM_{2.5}$. Emissions can vary substantially from day to day, depending on the level of activity, the specific type of operation, and, for dust, the prevailing weather conditions.

The Project would require the import of water for dust control. Approximately, 35 acre-feet of water would be used per year. Water would be provided by the City of San Diego through an existing water pipeline and meter on the Project site.

Section 2, Emissions Estimation Methodology, presents the methodology and assumptions used to estimate emissions from the Project. Appendix A presents details, including phasing and phase duration, off-road-equipment use (equipment type, quantity, horsepower, load factor, and hours of operation), and vehicle trips (internal haul trucks, vendor truck, and workers vehicle trips).

Table 7, Estimated Maximum Daily Criteria Air Pollutant Emissions – Unmitigated, shows the estimated maximum daily emissions associated with each proposed scenario.

Table 7. Estimated Maximum Daily Construction Criteria Air Pollutant Emissions – Unmitigated

Scenario	VOC	NO_x	CO	SO_x	PM_{10}	$PM_{2.5}$
	Pounds per Day					
1A	2.91	29.64	19.35	0.08	62.46	9.63
1B	2.91	29.59	18.19	0.06	32.86	4.89
2A	2.57	26.98	16.45	0.07	61.44	9.46
2B	2.57	26.07	15.27	0.05	31.75	4.70
Pollutant Threshold	*75*	*250*	*550*	*250*	*100*	*55*
Threshold Exceeded?	No	No	No	No	No	No

Source: See Appendix A.
Notes:
VOC = volatile organic compound; NOx = oxides of nitrogen; CO = carbon monoxide; SOx = sulfur oxides; PM10 = coarse particulate matter; PM2.5 = fine particulate matter.
Emissions represent maximum daily construction activities from sequential construction phases at any one point for a given year.
Estimated emissions include compliance with all regulations and SDAPCD Rule 55.

As shown in Table 7, maximum daily construction emissions of all scenarios would not exceed the thresholds for VOC, NO_x, CO, SO_x, PM_{10}, or $PM_{2.5}$. Therefore, impacts would be **less than significant**.

3.2.2.3 Mitigation

No mitigation is required.

3.2.2.4 Conclusion

Project emissions would not result in a cumulatively considerable net increase of any criteria pollutant for which the SDAB is nonattainment. Impacts would not be **cumulatively considerable**.

3.2.3 Would the project expose sensitive receptors to substantial pollutant concentrations?

Air quality varies as a direct function of the amount of pollutants emitted into the atmosphere, the size and topography of the air basin, and the prevailing meteorological conditions. Reduced visibility, eye irritation, and adverse health impacts upon sensitive receptors are the most serious hazards of existing air quality conditions in the area. Some land uses are considered more sensitive to changes in air quality than others, depending on the population groups and the activities involved. Air quality regulators typically define sensitive receptors as schools (preschool–12th grade), hospitals, resident care facilities, daycare centers, and other facilities that may house individuals with health conditions that would be adversely impacted by changes in air quality. However, for the purposes of CEQA analysis in the County, the definition of a sensitive receptor also includes residents.

The two primary emissions of concern regarding health effects for land development projects are DPM during construction and CO hotspots related to traffic congestion, as discussed below.

3.2.3.1 Guidelines for the Determination of Significance

A significant impact would result if:

- If a proposed development causes a six-lane road to deteriorate to LOS E or worse, the resulting longer queuing at the traffic signals could cause a localized significant air quality impact (City of San Diego 2016). A site-specific CO hotspot analysis should be performed to determine if health standards are potentially violated and to identify any affected sensitive receptor. If a proposed development causes a six-lane road to drop to LOS F, the resultant extended wait at the signalized intersections could cause a significant air quality impact (City of San Diego 2016). A site-specific CO hotspot screening and/or analysis should be performed to determine if health standards are potentially violated and to identify any affected sensitive receptor (City of San Diego 2016). If a proposed development causes a four-lane road to drop to LOS E or worse, the extended wait at the signalized intersection could cause a significant air quality impact. A site-specific CO hotspot screening and/or analysis should be performed to determine if health standards are potentially violated and to identify any affected sensitive receptor (City of San Diego 2016). If a proposed development is within 400 feet of a sensitive receptor and the LOS is worse than D, a site-specific CO hotspot analysis should be performed to determine if health standards are potentially exceeded and to determine the level of adverse effect on the receptors (City of San Diego 2016).

- Project implementation would result in exposure to TACs resulting in a maximum incremental cancer risk equal to or greater than 10 in 1 million, or cancer burden equal to or greater than 1.0, or total acute non-cancer health hazard index equal to or greater than 1.0, or total chronic non-cancer health hazard index equal to or greater than 1.0 would be deemed as having a potentially significant impact (County of San Diego 2007).

3.2.3.2 Significance of Impacts Prior to Mitigation

Carbon Monoxide Hotspots

A CO hotspot is a localized concentration of CO that is above the state or national 1-hour or 8-hour CO ambient air standards. Localized high levels of CO are associated with traffic congestion and idling or slow-moving vehicles. If a proposed development causes a six-lane road to deteriorate to LOS E or worse, the resulting longer queuing at the traffic signals could cause a localized significant air quality impact. A site-specific CO hotspot analysis should be performed to determine if health standards are potentially violated and to identify any affected sensitive receptors. If a proposed development causes a six-lane road to drop to LOS F, the resultant extended wait at the signalized intersections could cause a significant air quality impact. A site-specific CO hotspot screening and/or analysis should be performed to determine if health standards are potentially violated and to identify any affected sensitive receptor. If a proposed development causes a four-lane road to drop to LOS E or worse, the extended wait at the signalized intersection could cause a significant air quality impact. A site-specific CO hotspot screening and/or analysis should be performed to determine if health standards are potentially violated and to identify any affected sensitive receptor. If a proposed development is within 400 feet of a sensitive receptor and the LOS is worse than D, a site-specific CO hotspot analysis should be performed to determine if health standards are potentially exceeded and to determine the level of adverse effect on the receptors.

The Project's Transportation Impact Analysis (Dudek 2020) evaluated the impacts from traffic on the local area. The TIA showed that all studied intersections would operate at an acceptable level of service (LOS D or better). Further, the Project would not significantly contribute to peak-hour trips. As such, impacts related to CO hotspots from Project construction and decommissioning would be **less than significant**.

Toxic Air Contaminants

"Incremental cancer risk" is the net increased likelihood that a person continuously exposed to concentrations of TACs resulting from a project over a 9-, 30-, and 70-year exposure period would contract cancer based on the use of standard OEHHA risk-assessment methodology (OEHHA 2015). In addition, some TACs have non-carcinogenic effects. TACs that would potentially be emitted during construction activities would be DPM emitted from heavy-duty construction equipment and heavy-duty trucks. Heavy-duty construction equipment and diesel trucks are subject to CARB ATCMs to reduce DPM emissions. According to the OEHHA, HRAs, which determine the exposure of sensitive receptors to toxic emissions, should be based on a 30-year exposure period for the maximally exposed individual resident; however, such assessments should be limited to the period/duration of activities associated with a project (OEHHA 2015). Therefore, for this Project, the exposure period would be 10 years for scenarios 1A and 2A, 7 years for scenario 1B, and 5 years for Scenario 2B, consistent with the duration of Project activities. The emissions associated with monitoring are minimal and would not contribute to health risk impacts.

During Project activities, DPM emissions would be emitted from heavy-duty construction equipment and heavy-duty trucks, as well as TAC emissions within the fugitive dust generated by vehicle traffic, off-road equipment, and sediment processing. Heavy-duty construction equipment and diesel trucks are subject to CARB ATCMs to reduce DPM emissions.

An HRA was performed to evaluate the cancer and non-cancer risk from TAC emissions on existing sensitive receptors from Project activities. The HRA methodology is further described in Section 2.5, Health Risk Assessment, and the detailed assessment is provided in Appendix B. The results of the HRA for the Project are summarized in Table 8.

Table 8. Construction Activity Health Risk Assessment Results – Unmitigated

Impact Parameter	Units	Proposed Project Impact	CEQA Threshold	Level of Significance
Scenario 1A				
Cancer risk	Per million	3.1	1	**Potentially Significant**
Chronic non-cancer health hazard index	Not applicable	0.1	1.0	Less than Significant
Acute non-cancer health hazard index	Not applicable	0.04	1.0	Less than Significant
Lead exposure	µg/m^3	0.00003	0.12	Less than Significant
Scenario 1B				
Cancer risk	Per million	6.5	1	**Potentially Significant**
Chronic non-cancer health hazard index	Not applicable	0.1	1.0	Less than Significant
Acute non-cancer health hazard index	Not applicable	0.05	1.0	Less than Significant
Lead exposure	µg/m^3	0.00005	0.12	Less than Significant
Scenario 2A				
Cancer risk	Per million	2.8	1	**Potentially Significant**
Chronic non-cancer health hazard index	Not applicable	0.1	1.0	Less than Significant
Acute non-cancer health hazard index	Not applicable	0.04	1.0	Less than Significant
Lead exposure	µg/m^3	0.00003	0.12	Less than Significant
Scenario 2B				
Cancer risk	Per million	5.2	1	**Potentially Significant**
Chronic non-cancer health hazard index	Not applicable	0.1	1.0	Less than Significant

Table 8. Construction Activity Health Risk Assessment Results – Unmitigated

Impact Parameter	Units	Proposed Project Impact	CEQA Threshold	Level of Significance
Acute non-cancer health hazard index	Not applicable	0.04	1.0	Less than Significant
Lead exposure	µg/m³	0.00006	0.12	Less than Significant

Source: Appendix B
Notes: CEQA = California Environmental Quality Act; µg/m³ = microgram per cubic meter.

The results of the HRA demonstrate that the TAC exposure from construction diesel exhaust emissions and fugitive dust TACs would result in cancer risk on site above the 1 in 1 million threshold without application of T-BACT, chronic and acute non-cancer health hazard indexes of less than 1.0, and lead exposure less than 0.12 micrograms per cubic meter (µg/m³). Therefore, TAC emissions from construction and operation of the Project may expose sensitive receptors to substantial pollutant concentrations. Impacts would be **potentially significant** and mitigation is required.

Valley Fever Exposure

Valley Fever is not highly endemic to San Diego County, and within San Diego County, the incidence rate in the Project area is below the county average and the statewide average. The Project would comply with SDAPCD Rule 55, which would limit the amount of fugitive dust generated during construction. Strategies the Project would implement to comply with SDAPCD Rule 55 and control dust include watering two times per day and limiting speed on unpaved roads to 15 miles per hour. The nearest sensitive-receptor land use (existing residence) is located approximately 750 feet south of the Project site.

Based on the low incidence rate of Coccidioidomycosis in the Project region and in greater San Diego County, and the Project's implementation of dust control strategies, it is not anticipated that earth-moving activities would result in exposure of nearby sensitive receptors to Valley Fever. Therefore, Project impacts would be **less than significant** with respect to Valley Fever exposure for sensitive receptors.

3.2.3.3 Mitigation

Carbon Monoxide Hotspots

No mitigation measures would be required to address potential CO hotspots impacts.

Toxic Air Contaminants

Mitigation measure M-AQ-1 would be implemented to reduce emissions of TACs from construction-related exhaust.

M-AQ-1 Prior to the California Department of Parks and Recreation's approval of any construction-related permits, the Project applicant or its designee shall place the following requirements on all plans, which shall be implemented during each construction phase to minimize diesel particulate matter emissions:

a. Heavy-duty diesel-powered construction equipment shall be equipped with Tier 4 Final or better diesel engines for engines 75 horsepower or greater. The City of San Diego and/or County of

San Diego shall verify and approve all pieces within the construction fleet that would not meet Tier 4 Final standards.

b. Vehicles in loading and unloading queues shall not idle for more than 5 minutes and shall turn their engines off when not in use to reduce vehicle emissions.

c. All construction equipment shall be properly tuned and maintained in accordance with manufacturer specifications.

d. When construction equipment units that are less than 50 horsepower would be employed, that equipment shall be electrical or natural-gas-powered, where available.

e. A Construction Traffic Control Plan shall be developed to ensure construction traffic and equipment use is minimized to the extent practicable. The Construction Traffic Control Plan shall include measures to reduce the number of large pieces of equipment operating simultaneously during peak construction periods, schedule vendor and haul truck trips to occur during non-peak hours, establish dedicated construction parking areas to encourage carpooling and efficiently accommodate construction vehicles, identify alternative routes to reduce traffic congestion during peak activities, and increase construction employee carpooling.

With implementation of M-AQ-1, the Project would require the use of Tier 4 Final off-road equipment. The results of the HRA for Project construction, including M-AQ-1, are summarized in Table 9. The use of Tier 4 Final construction equipment would be considered T-BACT,[6] and the County's significance threshold would be 10 in 1 million, instead of the 1.0 in 1 million without implementation of T-BACT.

Table 9. Construction Activity Health Risk Assessment Results – Mitigated

Impact Parameter	Units	Proposed Project Impact	CEQA Threshold	Level of Significance
Scenario 1A				
Cancer risk	Per million	1.6	10	Less than Significant
Chronic non-cancer health hazard index	Not applicable	0.1	1.0	Less than Significant
Acute non-cancer health hazard index	Not applicable	0.04	1.0	Less than Significant
Lead exposure	µg/m^3	0.00003	0.12	Less than Significant
Scenario 1B				
Cancer risk	Per million	1.9	10	Less than Significant

[6] Per the County's guidance, T-BACT is determined on a case-by-case basis; however, an example of T-BACT includes diesel particulate filters. As required by M-AQ-1, the project would use off-road equipment that meets Tier 4 Final standards. To meet stringent Tier 4 Final particulate matter emissions standards, equipment manufacturers typically use diesel particulate filters, selective catalytic reduction systems that employ diesel particulate filters or combination diesel particulate filters and diesel oxidation catalysts, or other equivalent devices to remove DPM from the exhaust of a diesel engine. As such, T-BACT is reasonably expected to be achieved by the project's off-road equipment fleet. Because T-BACT is incorporated, the HRA for the project's mitigated scenario applies the maximum incremental cancer risk equal to or greater than 10 in 1 million threshold to evaluate the significance of health risk impacts.

Table 9. Construction Activity Health Risk Assessment Results – Mitigated

Impact Parameter	Units	Proposed Project Impact	CEQA Threshold	Level of Significance
Chronic non-cancer health hazard index	Not applicable	0.1	1.0	Less than Significant
Acute non-cancer health hazard index	Not applicable	0.05	1.0	Less than Significant
Lead exposure	µg/m³	0.00005	0.12	Less than Significant
Scenario 2A				
Cancer risk	Per million	1.5	10	Less than Significant
Chronic non-cancer health hazard index	Not applicable	0.1	1.0	Less than Significant
Acute non-cancer health hazard index	Not applicable	0.04	1.0	Less than Significant
Lead exposure	µg/m³	0.00003	0.12	Less than Significant
Scenario 2B				
Cancer risk	Per million	1.4	10	Less than Significant
Chronic non-cancer health hazard index	Not applicable	0.1	1.0	Less than Significant
Acute non-cancer health hazard index	Not applicable	0.04	1.0	Less than Significant
Lead exposure	µg/m³	0.00006	0.12	Less than Significant

Source: Appendix B
Notes: CEQA = California Environmental Quality Act; µg/m³ = microgram per cubic meter

The results of the HRA demonstrate that the TAC exposure from construction diesel exhaust emissions and fugitive dust sources would result in cancer risk on site below the 10 in 1 million threshold with application of T-BACT, chronic and acute non-cancer health hazard indices of less than 1.0, and lead exposure less than 0.12 µg/m³ for all scenarios.

3.2.3.4 Conclusion

Carbon Monoxide Hotspots

Project-related traffic on local roads would not contribute traffic volumes to intersections that would cause a CO hotspot. Thus, potential impacts associated with exposure of sensitive receptors to localized CO concentrations would be **less than significant**.

Toxic Air Contaminants

The Project's residential cancer risk, acute and chronic non-cancer health hazard indices, and lead exposure off site would be below County's thresholds with implementation of M-AQ-1; therefore, impacts would be **less than significant** after mitigation.

3.2.4 Other Emissions

Other emissions associated with the Project are anticipated to be limited to odors, which is assessed herein. Other emissions (including odors) are a form of air pollution that can present significant problems for both the source and surrounding community. Although offensive odors seldom cause physical harm, they can be annoying and cause concern.

3.2.4.1 Guidelines for the Determination of Significance

Based on Appendix G of the CEQA Guidelines and the County's Guidelines for Determining Significance and Report Format and Content Requirements – Air Quality (County of San Diego 2007), the Project would have a significant impact if:

- The project, which is not an agricultural, commercial, or an industrial activity subject to SDAPCD standards, as a result of implementation, would either generate objectionable odors or place sensitive receptors next to existing objectionable odors, which would affect a considerable number of persons.

California Health and Safety Code, Division 26, Part 4, Chapter 3, Section 41700, and SDAPCD Rule 51, commonly referred to as the public nuisance law, prohibit emissions from any source whatsoever in such quantities of air contaminants or other material that cause injury, detriment, nuisance, or annoyance to the public health or damage to property. The potential for an operation to result in odor complaints from a "considerable" number of persons in the area would be a significant, adverse odor impact.

Projects required to obtain permits from SDAPCD are evaluated by SDAPCD staff for potential odor nuisance, and conditions may be applied (or control equipment required) where necessary to prevent occurrence of public nuisance.

Odor issues are subjective because of the nature of odors themselves and because their measurements are difficult to quantify. As a result, this guideline is qualitative, and each project is reviewed on an individual basis, focusing on the existing and potential surrounding uses and location of sensitive receptors.

3.2.4.2 Significance of Impacts Prior to Mitigation

Section 6318 of the San Diego County Zoning Ordinance requires that all commercial and industrial uses be operated so as not to emit matter causing unpleasant odors that are perceptible by the average person at or beyond any lot line of the lot containing said uses. Section 6318 goes on to further provide specific dilution standards that must be met "at or beyond any lot line of the lot containing the uses" (County of San Diego 1979). SDAPCD Rule 51 (Public Nuisance) also prohibits emission of any material that causes nuisance to a considerable number of people, or endangers the comfort, health, or safety of any person. A project that involves a use that would produce objectionable odors would be deemed to have a significant odor impact if it would affect a considerable number of off-site receptors.

Land uses and industrial operations that are associated with odor complaints include agricultural uses, wastewater treatment plants, food processing plants, chemical plants, composting, refineries, landfills, dairies, and fiberglass molding. The Project would not include land uses that are associated with odor complaints. Potential odors produced from the Project would be attributable to concentrations of unburned hydrocarbons from tailpipes of construction equipment and from excavated sediment. These odors would disperse rapidly from the Project site and generally occur at magnitudes that would not affect substantial numbers of people. The Project would not include the development of facilities associated with sensitive receptors who would be sensitive to off-site odor generation.

The nearest off-site residential receptor to the Project is single-family residences, across the U.S./Mexico border from the Project site.

Project activities would result in the emission of diesel fumes and other odors typically associated with construction activities. These compounds would be emitted in varying amounts on the Project site depending on where activities are occurring. Sensitive receptors located within and in the vicinity of the site may be affected; however, odors are highest near the source and would quickly dissipate. Any odors associated with activities would be temporary and would cease upon Project completion; therefore, odor impacts would be **less than significant**.

3.2.4.3 Mitigation

No mitigation measures would be required to address potential odor impacts.

3.2.4.4 Conclusion

The Project would not include land uses commonly associated with odor complaints, and the Project would be required to comply with the County's odor policies enforced by the SDAPCD, including Rule 51, in the event a nuisance complaint occurs. Therefore, impacts associated with objectionable odors would be **less than significant**.

4 Greenhouse Gas Emissions Assessment

4.1 Thresholds of Significance

The significance criteria used to evaluate the proposed Project's GHG emissions impacts are based on the recommendations provided in Appendix G of the CEQA Guidelines. For the purposes of this GHG emissions analysis, the proposed Project would have a significant environmental impact if it would (14 CCR 15000 et seq.):

1. Generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment.
2. Conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs.

The Appendix G thresholds for GHG's do not prescribe specific methodologies for performing an assessment, do not establish specific thresholds of significance, and do not mandate specific mitigation measures. Rather, the CEQA Guidelines emphasize the lead agency's discretion to determine the appropriate methodologies and thresholds of significance consistent with the manner in which other impact areas are handled in CEQA. Additional guidance regarding assessment of GHGs is discussed below.

City of San Diego

The City's latest update to the CEQA Significance Determination Thresholds document in July 2016 added a GHG emissions threshold section. Pursuant to CEQA Guidelines Sections 15183.5(b), 15064(h)(3), and 15130(d), the City may determine that a project's incremental contribution to a cumulative GHG effect is not cumulatively considerable if the project complies with the requirements of a previously adopted GHG emission reduction plan.

Under the City's CEQA Thresholds, the method for determining significance for project-level environmental documents is through the CAP Consistency Checklist (City of San Diego 2017). The CAP Consistency Checklist is the primary document used by the City to verify project-by-project consistency with the underlying assumptions in the CAP and ensure that the City would achieve its emissions reduction targets. The CAP Checklist includes a three-step process to determine project consistency (City of San Diego 2017). Step 1 consists of an evaluation to determine the project's consistency with existing General Plan, Community Plan, and zoning designations for the site. If the proposed project is able to answer "yes" to Step 1 and demonstrate the proposed project would be consistent with existing General Plan, Community Plan, and zoning designations for the site, or the proposed project can demonstrate consistency with existing land uses by comparing the proposed project's GHG emissions with those that would be generated under existing land uses, then the proposed project may proceed to Step 2. If the proposed project must answer "no" to Step 1, then the proposed project would be deemed inconsistent with the CAP, and GHG impacts as identified under CEQA would be considered significant and unavoidable.

Step 2 includes the list of measures each project would be required to implement. Regardless of whether the project would answer "yes" or "no" to Step 1, implementation of the measures listed in Step 2 would be required for all projects, if applicable.

Step 3 would only be applicable for projects that would not be consistent with existing land use designations and would not be consistent with planned site land use GHG emissions, but that would be located in a Transit Priority Area (TPA) as defined by the City's Development Services Department. In accordance with SB 743, a TPA is defined as "an area within one-half mile of a major transit stop that is existing or planned, if the planned stop is scheduled to be completed within the planning horizon included in a Transportation Improvement Program adopted pursuant to Section 450.216 or 450.322 of Title 23 of the Code of Federal Regulations" (City of San Diego 2016b). Appendix B, Transit Priority Areas per SB 743, of the CAP includes a map of TPAs as designated by the City. The TPA map is based on the adopted SANDAG Regional Plan.

4.2 Impact Analysis

4.2.1 Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

4.2.2 Would the project conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

As stated previously, the City adopted the final CAP in 2015, which was followed by the "CAP Consistency Checklist Questions" on July 12, 2016, which was updated in June 2017. The CAP Consistency Checklist includes the following three steps:

1. Step 1 consists of an evaluation to determine the project's consistency with the existing General Plan, Community Plan, and zoning designations for the site.
2. Step 2 evaluates how the project will implement the required specific measures delineated in the checklist under Step 2.[7]
3. Step 3 evaluates the project's consistency with the CAP's transportation strategy.

Step 1 – Land Use Consistency

Projects which do not require a change in land use or zoning designation are generally considered to be consistent with Step 1 because the CAP's emissions were based on build out assumptions of the existing land uses at the time of the CAP's development. If a project would require a change in land use designation or zoning, the project may still be consistent with the CAP if the project is less GHG-emissions intensive than assumed in the CAP.

The proposed Project site is owned by the County but within the City's Tijuana River Valley Community Plan area. The site's APNs are 664-011-50-00 and 664-011-04-00 which combined total approximately 40 acres. The area of disturbance associated with the Project is approximately 30 acres with the majority occurring on APN 664-011-05-00. The site is situated in the southeast corner of Tijuana River Valley Regional Park. The site is bordered to the north and west by Monument Road and Old Dairy Mart Road and is bordered to the south by the U.S./Mexico International Border.

Under the City's General Plan, the Project site is designated as Open Space Parks and is listed as Proposition A land. Proposition A land is characterized as "very low-density, residential, open space, natural resource-based park, and agricultural uses" (City of San Diego 2015). Under the Tijuana River Valley Community Plan, the site is designated as Multiple Species Conservation Open Space, which prohibits any commercial recreation or urban residential land use designations. The Project site is zoned as AR-1-1, or Agricultural – Residential zones. Agricultural – Residential zones allow the development of single dwelling unit homes at a very low density (minimum 10-acre lots). The Project site's land use designation and zoning are not expected to change as a result of the Project. As such, the Project is consistent with the existing General Plan and Community Plan land use and zoning

[7] A complete CAP Consistency Checklist illustrating compliance with Step 2 is included as Attachment A to this memorandum.

designations, does not require a change in land use or zoning designation, and is consistent with Step 1, Land Use Consistency Option A, of the Checklist. There would be no difference between each scenario under Step 1.

Step 2 – CAP Strategies Consistency

The second step of the CAP consistency review is to review and evaluate a project's consistency with the applicable strategies and actions of the CAP. Step 2 only applies to development projects that involve permits that would require a certificate of occupancy from the Building Official or projects comprised of one- and two-family dwellings or townhouses as defined in the California Residential Code and their accessory structures. The Project would consist of the beneficial reuse of excess sediment managed by in-valley land managers and reclamation and restoration of the quarry site. The Project would not require a certificate of occupancy. In accordance with Step 2 of the CAP Checklist, all other development projects that would not require a certificate of occupancy from the Building Official shall implement Best Management Practices for construction activities as set forth in the Greenbook (for public projects). Specifically, the following sections of the Greenbook are applicable to the Project: Section 217 – Bedding and Backfill Materials; Section 300 – Earthwork; Section 301 – Subgrade Preparation, Treated Materials, Placement of Base Materials; Section 800 – Materials; and Section 801 – Installation. There would be no difference between each scenario under Step 2.

Therefore, the Project (and each scenario) would not conflict with the City's CAP and impacts related to GHG emissions would be considered less than significant.

5 Conclusions

As discussed in Section 3.2, all four scenarios evaluated were shown to not conflict with an applicable air quality plan for the region. All four scenarios were shown to not have a cumulatively considerable net increase in criteria air pollutants. All four scenarios showed cancer risk that was greater than the threshold prior to mitigation. With mitigation measure **MM-AQ-1**, cancer risk for all four scenarios was reduced to less than significant. All four scenarios would have a less than significant impact with respect to other emissions.

All four scenarios would not conflict with the City's CAP and would therefore have a less than significant impact on GHG Emissions.

Off-road Equipment - Based on State Parks provided information.

Off-road Equipment - Based on State Parks provided information.

Off-road Equipment - Based on State Parks provided information.

Off-road Equipment - Based on State Parks provided information.

Off-road Equipment - No equipment.

Trips and VMT - Based on State Parks provided information. Haul truck distance represents furthest distance from quarry site.

On-road Fugitive Dust - Assumes an off-road distance of 0.5 miles per trip.

Grading - CalEEMod defaults.

Vehicle Trips - Construction only.

Consumer Products - Construction only.

Area Coating - Construction only.

Landscape Equipment - Construction only.

Energy Use - Construction only.

Water And Wastewater - Does not apply.

Solid Waste - Construction only.

Construction Off-road Equipment Mitigation - In accordance with SDAPCD Rule 55.

Off-road Equipment - Based on State Parks provided information.

Off-road Equipment - Based on State Parks provided information.

Off-road Equipment - Based on State Parks provided information.

Off-road Equipment - No equipment.

Trips and VMT - Based on State Parks provided information. Haul truck distance represents furthest distance from quarry site.

On-road Fugitive Dust - Assumes an off-road distance of 0.5 miles per trip.

Grading - CalEEMod defaults.

Vehicle Trips - Construction only.

Consumer Products - Construction only.

Area Coating - Construction only.

Landscape Equipment - Construction only.

Energy Use - Construction only.

Water And Wastewater - Water use for dust suppression only.

Solid Waste - Construction only.

Construction Off-road Equipment Mitigation - In accordance with SDAPCD Rule 55.

Off-road Equipment - No equipment

Off-road Equipment - Based on State Parks provided information.

Off-road Equipment - Based on State Parks provided information.

Off-road Equipment - Based on State Parks provided information.

Off-road Equipment - Based on State Parks provided information.

Off-road Equipment - Based on State Parks provided information.

Off-road Equipment - No equipment.

Trips and VMT - Based on State Parks provided information. Haul truck distance represents furthest distance from quarry site.

On-road Fugitive Dust - Assumes an off-road distance of 0.5 miles per trip.

Grading - CalEEMod defaults.

Vehicle Trips - Construction only.

Consumer Products - Construction only.

Area Coating - Construction only.

Landscape Equipment - Construction only.

Nelson Sloan Quarry HRA Mitigated - San Diego County, Annual

Energy Use - Construction only.

Water And Wastewater - Water use for dust suppression only.

Solid Waste - Construction only.

Construction Off-road Equipment Mitigation - In accordance with SDAPCD Rule 55.

3.0 Construction Detail

Construction Phase

Nelson Sloan Quarry HRA Mitigated - San Diego County, Annual

Phase Number	Phase Name	Phase Type	Start Date	End Date	Num Days Week	Num Days	Phase Description
1	Phase 1	Site Preparation	9/1/2021	9/8/2021	5	6	
2	Phase 2 - 1	Site Preparation	9/9/2021	11/30/2021	5	59	
3	Phase 1 Revegetation Monitoring	Trenching	9/9/2021	9/2/2026	5	1300	
4	Phase 2 - 2	Site Preparation	9/1/2022	10/28/2022	5	42	
5	Phase 3 - 1	Site Preparation	10/29/2022	11/30/2022	5	23	
6	Phase 3 - 2	Site Preparation	9/1/2023	11/30/2023	5	65	
7	Phase 3 - 3	Site Preparation	9/1/2024	11/19/2024	5	57	
8	Phase 4 - 1	Site Preparation	11/20/2024	11/29/2024	5	8	
9	Phase 3 Revegetation Monitoring	Trenching	11/20/2024	11/13/2029	5	1300	
10	Phase 4 - 2	Site Preparation	9/1/2025	11/28/2025	5	65	
11	Phase 4 - 3	Site Preparation	9/1/2026	11/30/2026	5	65	
12	Phase 4 - 4	Site Preparation	9/1/2027	11/30/2027	5	65	
13	Phase 4 - 5	Site Preparation	9/1/2028	9/12/2028	5	8	
14	Phase 5 - 1	Site Preparation	9/13/2028	11/30/2028	5	57	
15	Phase 5 - 2	Site Preparation	9/1/2029	11/30/2029	5	65	
16	Phase 5 - 3	Site Preparation	9/1/2030	11/29/2030	5	65	
17	Phase 5 - 4	Site Preparation	9/1/2031	10/2/2031	5	24	
18	Phase 6 - 1	Site Preparation	10/3/2031	11/28/2031	5	41	
19	Phase 5 Revegetation Monitoring	Trenching	10/3/2031	9/25/2036	5	1300	
20	Phase 6 - 2	Site Preparation	9/1/2032	11/30/2032	5	65	
21	Phase 6 - 3	Site Preparation	9/1/2033	11/30/2033	5	65	
22	Phase 6 - 4	Site Preparation	9/1/2034	11/30/2034	5	65	
23	Phase 6 - 5	Site Preparation	9/1/2035	9/27/2035	5	19	
24	Phase 6 Revegetation Monitoring	Trenching	9/28/2035	9/20/2040	5	1300	

Acres of Grading (Site Preparation Phase): 0

Acres of Grading (Grading Phase): 0

Acres of Paving: 0

Residential Indoor: 0; Residential Outdoor: 0; Non-Residential Indoor: 0; Non-Residential Outdoor: 0; Striped Parking Area: 0 (Architectural Coating – sqft)

Off-road Equipment - Based on State Parks provided information.

Off-road Equipment - Based on State Parks provided information.

Off-road Equipment - Based on State Parks provided information.

Off-road Equipment - Based on State Parks provided information.

Off-road Equipment - Based on State Parks provided information.

Off-road Equipment - No equipment.

Trips and VMT - Based on State Parks provided information. Haul truck distance represents furthest distance from quarry site.

On-road Fugitive Dust - Assumes an off-road distance of 0.5 miles per trip.

Grading - CalEEMod defaults.

Vehicle Trips - Construction only.

Consumer Products - Construction only.

Area Coating - Construction only.

Landscape Equipment - Construction only.

Nelson Sloan Quarry HRA Haul Trucks Only - San Diego County, Annual

Energy Use - Construction only.

Water And Wastewater - Water use for dust suppression only.

Solid Waste - Construction only.

Construction Off-road Equipment Mitigation - In accordance with SDAPCD Rule 55.

Off-road Equipment - Based on State Parks provided information.

Off-road Equipment - No equipment.

Trips and VMT - Based on State Parks provided information. Haul truck distance represents furthest distance from quarry site.

On-road Fugitive Dust - Assumes an off-road distance of 0.5 miles per trip.

Grading - CalEEMod defaults.

Vehicle Trips - Construction only.

Consumer Products - Construction only.

Area Coating - Construction only.

Landscape Equipment - Construction only.

Nelson Sloan Quarry HRA Fugitive Dust Only - San Diego County, Annual

Energy Use - Construction only.

Water And Wastewater - Water use for dust suppression only.

Solid Waste - Construction only.

Construction Off-road Equipment Mitigation - In accordance with SDAPCD Rule 55.
